

Load Isolating Switch YGLR / Disconnect Switch

Load Isolating Switch YGLR

YGLR series of load isolating switch fuses is a kind of multi-electrode, manual operational switch, which uses glass fiber, reinforced unsaturated, polyester molding materials with a very high dielectric property, defend ability and reliable operational security.

YGLR load isolating switch applies spring-storage, the instantaneous release accelerating components and the parallel double-break points that have nothing with operation handle greatly improves the electrical performance and mechanical performance.

The group of load isolating switch fuses can ensure load circuit on or off, and a reliable security protection of over-current or short-circuit.

Obvious visible disconnecting state.

Strong resistance capacity of hot and humidity.

The fuses of load isolating switch have a three-electrodes and four-electrodes (3 + may be off a neutral-pole). According to the fuses, they were divided into 63 A ~ 630A.
